

Go Research

The Go Research Project plays a key role in the preservation of this magnificent wilderness and the future success of Harnas whose aim is to provide wildlife with a vast and untouched habitat. Take a break from your studies or daily routine and come and experience nature at its primitive best, smell the dust and feel the heat of Africa. We need you to make a difference today.

Role of the volunteer:

Go Research offers you the opportunity to be actively involved in any of the following research activities on Harnas:

- Game counts, night drives and predator call-ups
- Distribution of different kinds of game species
- Grazing patterns of the herbivores
- Eating habits of the carnivores
- Data basing and tracking of collared animals
- Monitoring the behavioural patterns of the different animals
- Stress factors or
- Interaction between the different predators.
- Bird observations – Creating a thorough bird species database

Harnas gives you the opportunity to help establish and or maintain a working database on the many different wild (and not so wild) animals that can be found on Harnas. Your contribution might help to make a difference in so many animal lives.

Accommodation will be at the Volunteer village.

Do I need experience? Not necessarily.

Although a diploma and/or certificates relevant to the project or work experience as a wildlife researcher or animal behaviourist are an added advantage, anyone considering studying towards a nature science degree or a deep interest in wildlife research will be considered.

Required length of stay as a Research volunteer is minimum 4 weeks and a maximum of 3 months. The program allows for 6 volunteer at a time.

Please note that whilst there are no Go Research activities, you will partake in the Go Wildlife activities!
